MindBridge

Financial Audits, Evolved

The audit tools of today are not keeping pace with the needs of modern audit professionals. Existing computer assisted audit tools (CAATs) are often time consuming to use and do not provide the insights and analytics required to help effectively advise auditors or develop comprehensive financial. MindBridge provides intelligent audit technology to help increase the speed and accuracy of every audit.

Take audit efficiency to the next level

Automation is key to maximizing the efficiency of each financial audit or review your organization performs. By removing manual processes, it is possible to streamline time-consuming activities, which frees up team members to use their expertise more effectively.

Three ways that MindBridge helps you be more efficient:

- Automated data intake saves you time importing data

- Automated risk-scoring is based on a blend of control points and anomaly detection algorithms to help guide you to entries that appear suspicious

- Automated insights recommend similar items to look at and which steps to take next

Comprehensive analysis for accurate audits

What if you could review every record from every file across every department? Auditors today are limited by time and their tools, restricting themselves to random sampling and data filtering. With MindBridge there is no dataset too large meaning the system is capable of reviewing 100% of the data provided and calculating a risk score for every process or person that interacts with corporate data. This is how you can find more instances of suspicious financial discrepancies.

Intelligent fraud detection to help you:

- Uncover more misstatements & potential fraud by reviewing 100% of corporate data

- Know where to look due to intelligent risk-scores

- Smarter control points that combine best practices and data science

- An intelligent system leveraging machine learning that adapts to your needs

"MindBridge is changing the way we approach fraud and financial analytics by using machine learning to understand the entire financial operations and then use this understanding of the data to find fraud ... and put the power to stop loss early back in the hands of the organization itself."

Intelligent audits start here

MindBridge is a revolutionary approach to audits that automates manual processes and provides a risk-based assessment, helping organizations ensure compliance and catch more fraud.
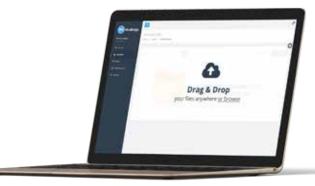

Risk-based scoring

An unbiased analysis of each individual's transaction history based on numerous control points and data science algorithms.

Accessibility

For maximum impact, the system is intuitive requiring little to no training meaning it can be used by anyone for the most basic of audits all the way up to a forensic investigation.

Security

All data is encrypted in transmission and at rest, ensuring the protection of sensitive data.

Streamlined data import

Eliminate tedious data collection processes by simply dragging and dropping files to an automated import folder.

Audit trail

Maintain a log of user activity to adhere to mandatory compliance standards.

Machine Learning

A evolving platform that will leverage the skills of your best auditors and share the insights with everyone else.

Audit dashboard

A visual summary of all transaction data and risk scores so that each auditor can determine where to focus instead of using sampling techniques alone.
